

bisoft WRZ

Tool Management

Efficient application of tools

bisoft WRZ

bisoft WRZ supports you efficiently and time-effectively in tool and resource planning. Tool statistics supervise the life-time of tools and inform on maintenance. Tool planning secures correct planning, multiple allocations are obviated. Availability and costs of individual tools are available online. The module can be utilized according to your requirements and tools can be allocated to individual machines or workstations at individual machines and orders. Information on the shortest, longest and average life-time of tools is available. In tool master data additional information on life-time and remaining running times of individual tools is available, as also the evaluation of tool stoppage times in respect of a supplier.

Tool management secures productivity and availability.

Advantages at a glance:

- Preventive maintenance through cycle control
- Tool costs can be clearly allocated
- No stoppages through tool shortage
- Real-time documentation
- Administration of tool stocks
- Automatic recording of operational and stoppage times via BDE/MDE, tool maintenance
- Tool allocation in relation to planning list
- Tool history

WRZ OVERVIEW:

bisoft WRZ

Tool planning and resources optimised simply and efficiently with bisoft WRZ. Online evaluations, records on variable time periods and information on tool master data is available at all times. An overview in real-time of all tools on the tool list in use is available. Reports enable long-time evaluations according to individual tools and resources. In addition, tool master data provides a permanent overview of individual stoppage times, remaining running times of individual tools and the evaluation of tool stoppage times with regard to

the supplier. Tool master data contains the information (name, stock location, ...) required for identification. Technical data and requirements such as necessary stoppage times are also stored in tool master data. Tools are then allocated to orders on the planning list. Tools are automatically activated when the order is registered at the recording point. During the tool operating time key figures for current running time, quantities and other values are available.

gbo datacomp

transparent – efficient – cost-saving

gbo datacomp as a comprehensive solutions provider in the area of production management systems (MES) will increase the competitive capabilities of your company. More than 30 years experience in software development and innovative hardware products have convinced notable companies at home and abroad.
