

¼" – 1" Back Pressure Regulators FOR GAS, LIQUID, AND MIXED PHASE SERVICE

Equilibar Difference

Our performance.

Equilibar[®] back pressure regulators outperform the competition, particularly in applications with low flow rates, mixed phase fluids, corrosive media, or extreme temperatures.

Our people.

Every inquiry gets focused attention from our engineering team to determine the best possible product for your needs. Every back pressure regulator is hand assembled and tested to meet our stringent quality standards.

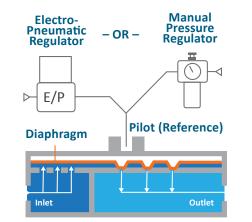

Our priorities.

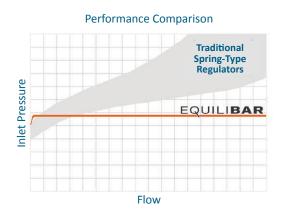

Our goal is to exceed your expectations. In an industry where delivery times frequently exceed 6 weeks, we offer many of our standard products with delivery in about two weeks.

Traditional back pressure regulators set the upstream pressure with a spring. These designs utilize sliding seals and other moving parts that can introduce hysteresis and other undesired effects into a process. The Equilibar[®] back pressure regulator uses a thin, supple diaphragm as the only moving part. This allows frictionless operation without cracking pressure or hysteresis. The accuracy of the Equilibar[®] back pressure regulator is limited only by the accuracy of the pilot setpoint.

How It Works

Simply load the Equilibar® back pressure regulator with a pilot pressure equal to the desired back pressure and the Equilibar does the rest. This pressure forces the flexible diaphragm down onto a plate of orifices. A rise in inlet pressure lifts the diaphragm up to allow excess pressure to be relieved through the outlet orifices. Similarly, a loss of pressure at the inlet causes the diaphragm to be pushed closer to the orifices, restricting flow and rebuilding pressure upstream.

Pilot operate your Equilibar[®] back pressure regulator with an electronic pressure regulator for automated back pressure control.

Or set the pilot pressure with a precision pressure reducing regulator for manual control.

Manual and electronic pilot regulators are sold separately

ТҮРЕ	PRESSURE REDUCING REGULATOR	BACK PRESSURE REGULATOR		
SCHEMATIC				
CONTROLS PRESSURE	Downstream	Upstream		
OPENS TO	Increase downstream pressure	Decrease upstream pressure		
CLOSES TO	Decrease downstream pressure	Increase upstream pressure		

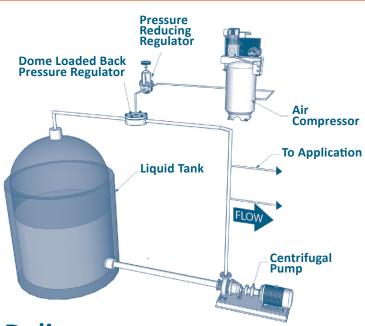

BACK PRESSURE REGULATORS VS PRESSURE REDUCING REGULATORS

Pressure reducing regulators reduce a higher supply pressure at the inlet down to a regulated lower pressure at the outlet (downstream). Back pressure regulators work the opposite way. They regulate the inlet (upstream) pressure by opening up only as much as necessary to hold back the desired pressure at the inlet (upstream).

Controlling Pump Output Pressure

A common application for a back pressure regulator is shown in the schematic at right. A pump cannot build discharge pressure unless there is resistance on its outlet piping. A properly sized back pressure regulator can create just the necessary amount of resistance to accurately control pump discharge pressure.

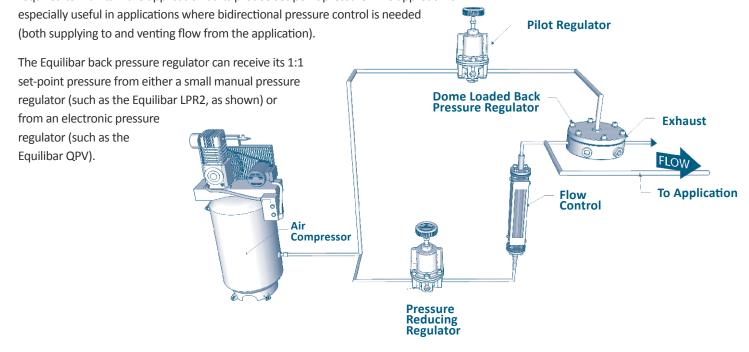

Note that the concept of pressure bypass control works equally well for all types of pumps (i.e. centrifugal pumps as well as positive displacement pumps). When used this way, a back pressure regulator is also referred to as a pressure sustaining valve or pressure bypass valve.

Precision Low Pressure Gas Delivery Tubing Extrusion Systems

Tubing extrusion is an example of an application where very low pressure control is required across widely varying flow rates. It is difficult to identify a pressure reducing regulator or automated control valve that can respond with adequate speed and precision in this range below 0.5 psig (34 mbar).

Equilibar[®] precision back pressure regulators are frequently used for these extrusion control applications because of their high sensitivity in this low pressure range. When the GS Series BPRs are fitted with highly sensitive diaphragms, they can control pressure down to the range of 0.03 psig (2 mbar). In the schematic below, a flow controller, such as a rotameter, is used to establish a flow rate greater than the maximum required for the application. The back pressure regulator is set to vent off all flow greater than what is required to maintain the application at its precise set-point pressure. This approach is

Fuel Pump, Fuel Injector and Fuel Rail Testing

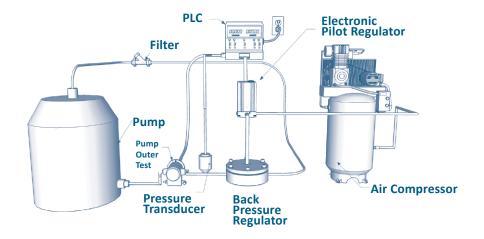

In fuel system component testing, it is desirable to perform development and quality assurance tests at or close to actual operating conditions. This means varying the back pressure and the rpm of the unit(s) during the testing cycle. Varying speed is a well known process, but varying back pressure may get complicated or costly. Equilibar back pressure regulators can simplify the design of the test rig and provide reliable performance under high cycle service.

In the schematic below, the pump under test provides flow to

an Equilibar back pressure regulator which has a pneumatic

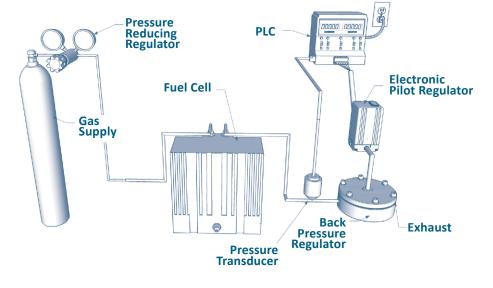

pilot signal from an electro-pneumatic controller driven by a test computer with the desired rpm, flow, and pressure sequences. The tests can simulate the actual service conditions of varying loads and speeds, enabling a better prediction of performance in use. The same test stand can be used for quality assurance product tests.

Benefits: The pressures can be modulated rapidly to create high-cycle lifetime tests in a relatively short period of time, as the Equilibar regulator has a flexible diaphragm as its only moving part.

Back Pressure Regulators for Fuel Cells

The Equilibar[®] precision back pressure regulator is the perfect fit for many fuel cell applications. Fuel cell testing systems, in particular, benefit from the high sensitivity in the low to mid pressure ranges that is lacking in most competitive products. Equilibar's GR trim was designed in response to the demanding flow rate requirements of the fuel cell testing industry. These back pressure regulators can provide stable stack pressures through ultra wide flow rate ranges required for rigorous test protocols. Gas flow rate control is possible down to below 1 ml/minute. The superior low flow control results in an incredible 1000:1 flow rate turndown ratio.

Our Key Performance Advantage

Traditional back pressure regulators use springs and sliding seals and develop overpressure with increasing flow as the spring is gradually compressed.

The Equilibar[®] back pressure regulator uses only a frictionless flexible diaphragm to modulate the pressure. It opens fully with minimal overpressure, is highly sensitive, and exhibits virtually no dead-band or hysteresis.

PRECISION OVER VARYING FLOW RANGES

The inlet pressure of most back pressure regulators varies significantly with changes in process flow.

The chart at right shows how the Equilibar GS/GSD regulator holds a constant process pressure even through widely varying flow rates. The GS/GSD regulator provides stable pressure control across flow ranges of 1000:1, and up to 10,000:1 in many applications.

LIQUID OR GAS APPLICATIONS

Unlike traditional pressure regulators, the GS Series is equally suited for liquid and gas applications.

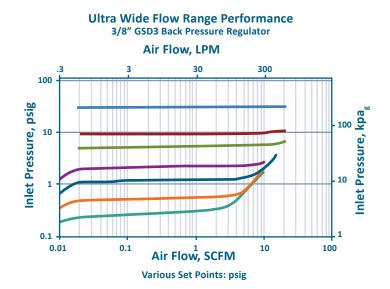

The water performance curves at right show gradual pressure build above set-point as shear develops inside the regulator.

The logarithmic chart below shows excellent pressure stability down to very low flow rates. Because of this wide turn-down ratio, it is possible to size the Equilibar BPR for each application's required precision.

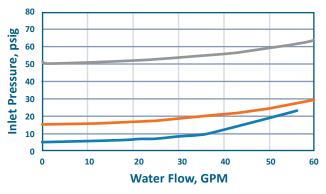

MIXED PHASE APPLICATIONS

Mixed phase applications cause problems for traditional pressure regulators because of the great variation in density between liquid and gas. However, the Equilibar BPR is able to process these density changes with minimal pressure disruption.

GS Series Part Number Key

This part number key explains our part numbering system and possible model options. All of our BPRs are custom-configured by our engineers based on the customer's specific application's parameters (process fluid, pressures, flow rates, temperature, etc.). Our engineers will request process operating parameters in order to build and quote a full part number for a suitable regulator. This chart is a reference to help understand the chosen part number.

Options marked in blue are typically in stock for fast shipment

Manual Pilot Control Options

Equilibar precision back pressure regulators get their setpoint control signal using a fluid pressure called 'reference' or 'pilot' pressure on their top dome port. The reference pressure is set using a pressure reducing regulator or electronic pressure regulator sold separately.

You can supply your own pilot pressure regulator or choose one of the popular pilot setpoint regulators below and on the next page.

This page shows manual pressure reducing regulator options for a range of pressure conditions. Electronic pressure regulators for automated pressure control are described on the next page.

Electronic Pilot Control Options

Automating your process pressure is easily accomplished by using an electronic pressure regulator to provide the pilot setpoint pressure to the Equilibar dome-loaded back pressure regulator.

The electronic pressure control devices described below and on our website are custom tuned at the factory to work with Equilibar precision back pressure regulators or vacuum regulators.

Contact Equilibar or visit our website for additional details about the pilot pressure control options available for purchase.

	REGULATOR DESCRIPTION		KEY FEATURES		
QPV Series		High Precision Low Pressure Regulator Controls up to 150 psi (10 bar) 4-20 mA or 0-10 VDC	 Controls to 150 psig(10 bar) Available in gauge, absolute, vacuum and vacuum-positive ranges Superior proportional valve action Tuned ready for setpoint pilot service Optional DeviceNet / Serial communication IP65 enclosure 		
EPC Series EHP Series		Precision Electroic Pressure Controller EPC Model Controls up to 150 psig (10 bar) EHP Model controls up to 500 psig (34 bar) 4-20mA or 0-10V Analog 3.3V Serial Digital	 Models control to 150 psig (10 bar); 500 psig (34 bar); Available in gauge, absolute,vacuum Dual analog valve construction Factory set for your pressure Digital or analog communication IP65 enclosure 		
EPR Series		High Resolution Electronic Pressure Regulator Controls up to 3000 psi (200 bar) 4-20 mA or 0-5 VDC Analog RS232 or RS485 Digital	 Models control to 150 psig (10 bar); 500 psig (34 bar); 1000 psig (69 bar); 3000 psig (207 bar) Available in gauge, absolute Proportional inlet & outlet valves for maximum stability No gas wasted at steady state Factory set for your pressure Digital or analog communication Direct control from the keypad IP40 enclosure 		

EQUILIBAR 11

About Equilibar

Equilibar provides innovative and robust pressure control technology for researchers and engineers worldwide. We are proud to design, manufacture, and test our patented back pressure regulators in our factory overlooking the Blue Ridge Mountains near Asheville, NC.

APPLICATION ENGINEERING-WHAT SETS US APART

Unlike mass-market regulator distributors, we focus on working with you, the scientist or engineer with a complex pressure control scenario.

Our application engineers work collaboratively with clients to identify the optimal model, trim, and diaphragm for each application's unique challenges. No matter where you are on the globe, you can stay in close contact with your engineer by email, telephone, videoconferencing, or fax.

After installation, your application engineer will support you with start-up information and fine-tuning as needed.

Equilibar, LLC 320 Rutledge Rd. Fletcher, North Carolina 28732 United States Tel: +1-828-650-6590 Fax: +1-801-504-4439 Monday - Friday 8:00 AM - 5:00 PM EST 12:00 - 21:00 GMT inquiry@equilibar.com

Each application is reviewed by our engineering team to ensure quality performance of our products.

Our engineers offer custom designed solutions for the most difficult pressure control challenges. Feel free to contact us to discuss your situation.

Made in the USA

Equilibar's quality system is **ISO 9001:2015** certified.
